# Closed Containment Aquaculture

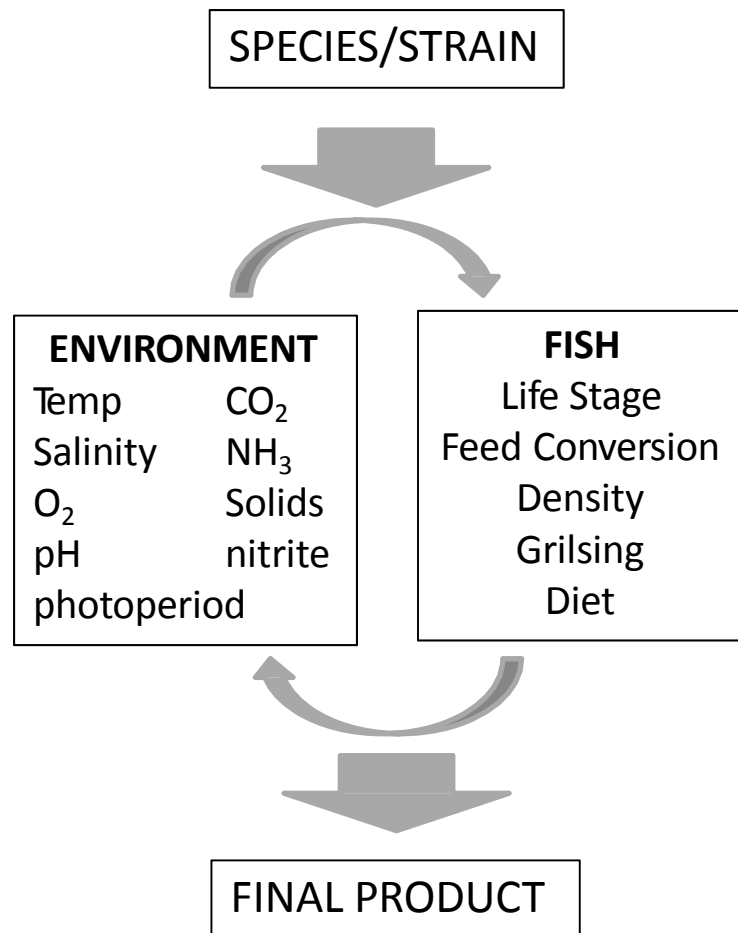

## The Goal

Grow salmon in RAS from smolt to adult as quickly as possible, with as little food as possible, whilst maintaining the highest possible product quality.

# Factors Affecting Growth

# Factors Affecting Growth

By using RAS to grow salmon, we have the opportunity to rear fish under conditions that maximize growth, welfare, and product quality.

# *InSEAS* Research

Determine the optimal conditions for rearing salmon in RAS.

- The possible combinations of parameters that may affect growth are enormous.
- Multi-tiered approach to determine the optimal rearing conditions for salmon:
  1. Regression approach
  2. Subsequent replication
  3. Multi-factorial studies

# Effects of Salinity on Fish

Salmon in fresh water

Salmon in sea water

Maintaining salt balance can account for 10-50% of resting metabolic rate

# Effects of Salinity on Fish

Salmon at intermediate salinity

Hypothesis:

Growth will be enhanced at an intermediate salinity.

# *InSEAS* Regression Approach

*Determine the optimal salinity for growth, performance and welfare of Atlantic and coho salmon from smolt to adult.*

# *InSEAS* Regression Approach

In a single experiment, we could determine the optimal value for a given parameter in two species across multiple life stages.

# *InSEAS* RAS Research Facility

- 7 high-density independent recirculation systems ( $120 \text{ kg/m}^3$ )  
Each system has 2 x  $5 \text{ m}^3$  tanks and 2 x  $0.7 \text{ m}^3$  tanks
- Automatic feeders on large tanks
- Environmental control and monitoring systems

# Is fish growth affected by system?

## Initial Testing of RAS

- Do fish grow at the same rate in each RAS when held under the same conditions?
- Completed a growth trial with coho salmon in 2014

# Is fish growth affected by system?

Growth rate was similar in each system at 2.1 to 2.5 g/day

# Defining Optimal Salinity

Rear coho & Atlantic salmon for 12-15 months at 5 salinities ranging from freshwater to seawater at 13°C  
(0, 5, 10, 20, and 30ppt)

Stocking density maintained at 40 kg/m<sup>3</sup>

Coho salmon growth trials started in May 2015

Atlantic salmon growth trials started in July 2015

Both large & small tanks

Monitor growth, feed conversion, maturation & physiological robustness

Coho reared in small tanks at  
 intermediate salinities  
 appear to grow faster with lower  
 feed conversion ratios than at  
 higher salinities.

# Summary

## Coho Salmon in RAS

At small sizes, growth is enhanced at 10 ppt compared with 0, 20, & 30 ppt

At 5 and 10 ppt salinity, feed conversion ratios are lowest

Both large & small tank experiments suggest that coho salmon grow better at intermediate salinities

Coho reared at intermediate salinities show better colouration and tank behaviour (data not shown) suggesting they are experiencing less stress

# Atlantic Salmon

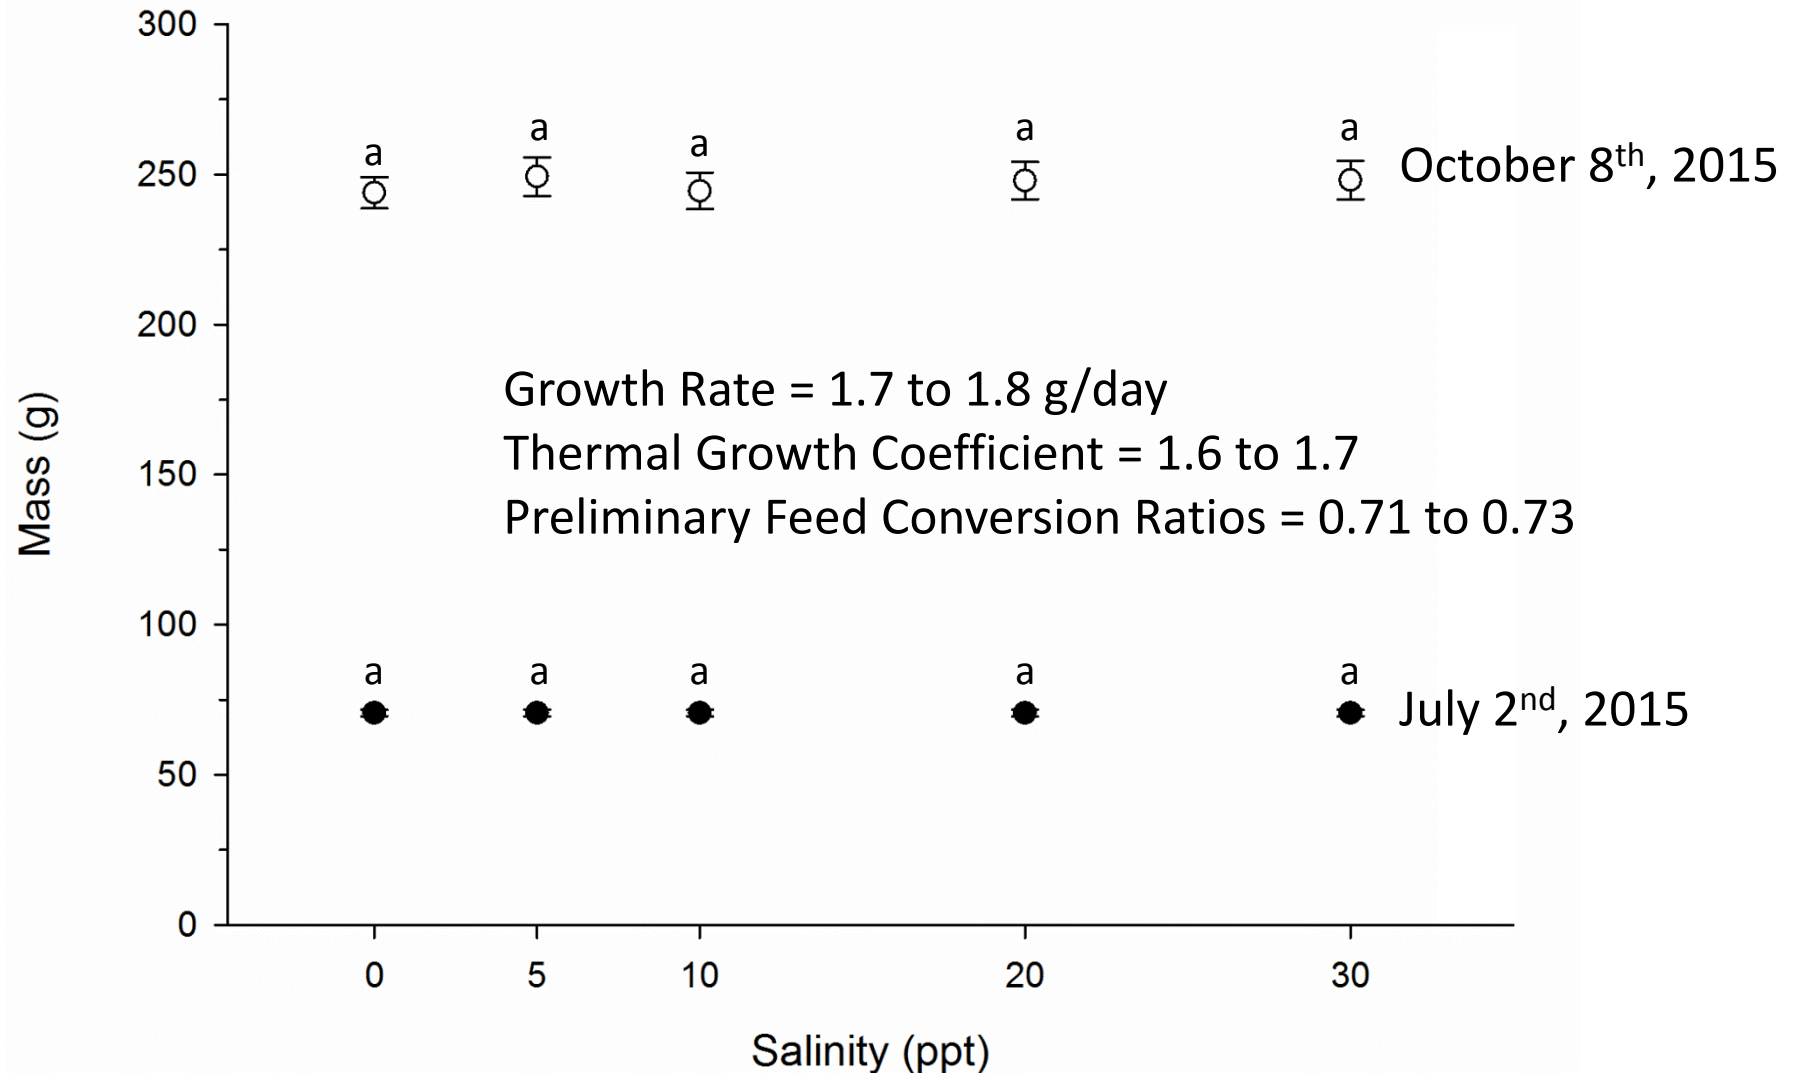

## Growth in 5 m<sup>3</sup> tanks

# **Conclusions**

## **Coho & Atlantic Salmon**

### **Coho Salmon**

- Intermediate salinities appear to improve growth compared with freshwater and seawater
- Data on optimal salinity derived from small and large tank experiments appear consistent

### **Atlantic Salmon**

- Between 75 and 250 g, salinity has no effect on growth or feed conversion ratios.

# **Future Directions**

## **Coho & Atlantic Salmon**

**Growth trials will continue for 10 – 12 months**

- Will assess growth rate, FCR & morphometrics every 2 to 3 months
- Pit tagged fish for evaluation of individual growth rates
- Assess stress tolerance and physiological status every 2 to 3 months
- Monitor for early maturation in Atlantic salmon
- Assess fillet quality
