Why we're doing this

KUTERRA

Land Raised[™] Atlantic Salmon farm

Who is involved

Project partners

Lead **funders**

Marketing partner

Our mission

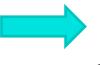

Assess technical, biological, economic feasibility

of raising Atlantic salmon to harvest size using land-based RAS.

Final reporting

- http://tidescanada.org/programs/
 salmon-aquaculture-innovation-fund/
- Final milestone report
- Capital cost retrospective report
- Addendum on Cohort 4, expansion assumptions
- IEMP final report from Pacific Salmon Foundation

Economic focus

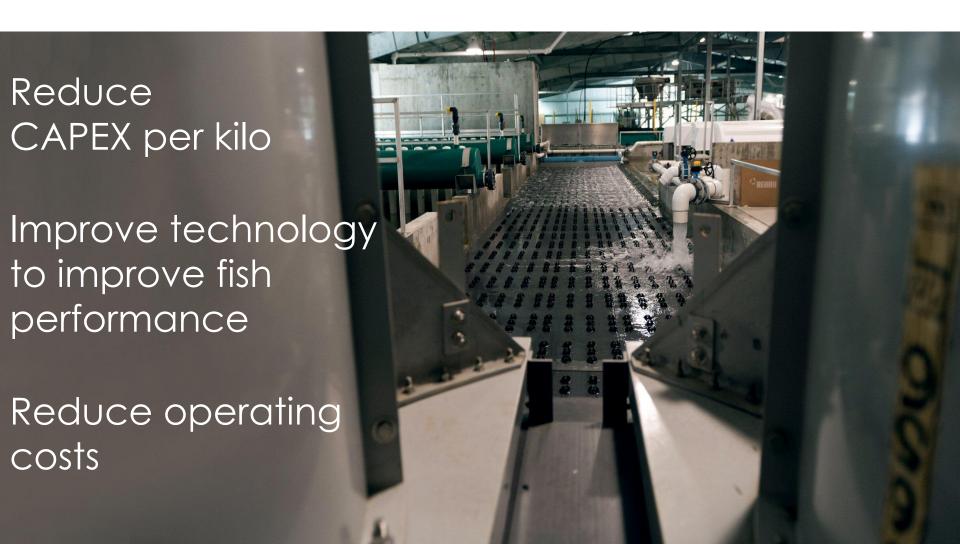

Technological feasibility

DEFINITION: Create an environment that can grow and harvest healthy fish. **DONE**

Optimizing technology

Biological feasibility

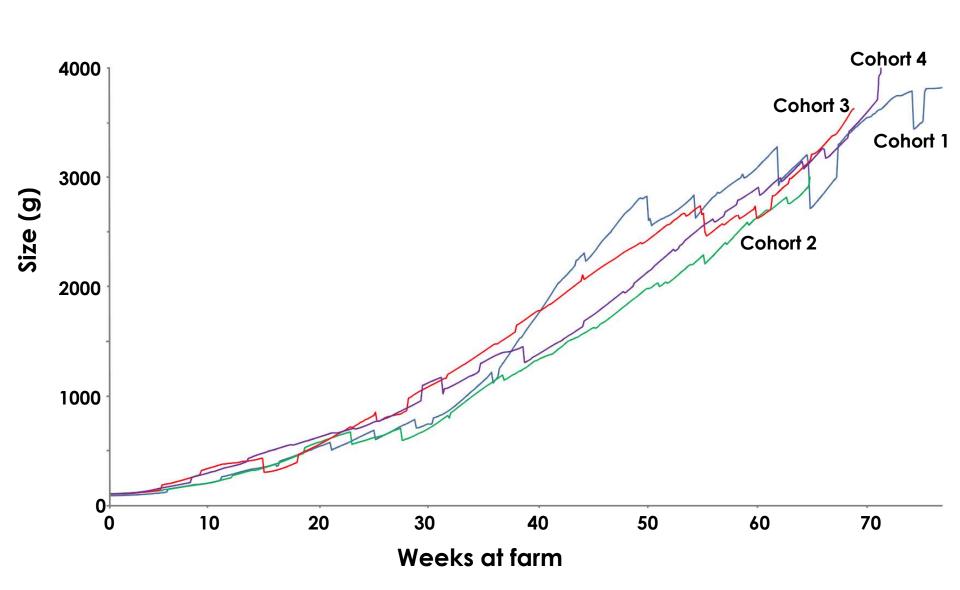

DEFINITION: Efficiently grow high volumes of healthy, premium quality fish. **STEADILY IMPROVING**.

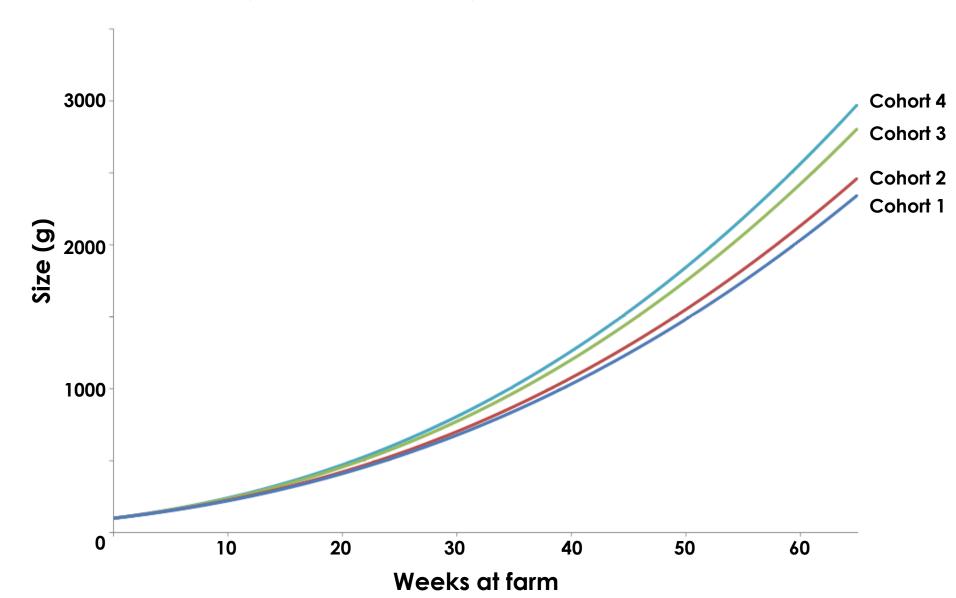

Growth

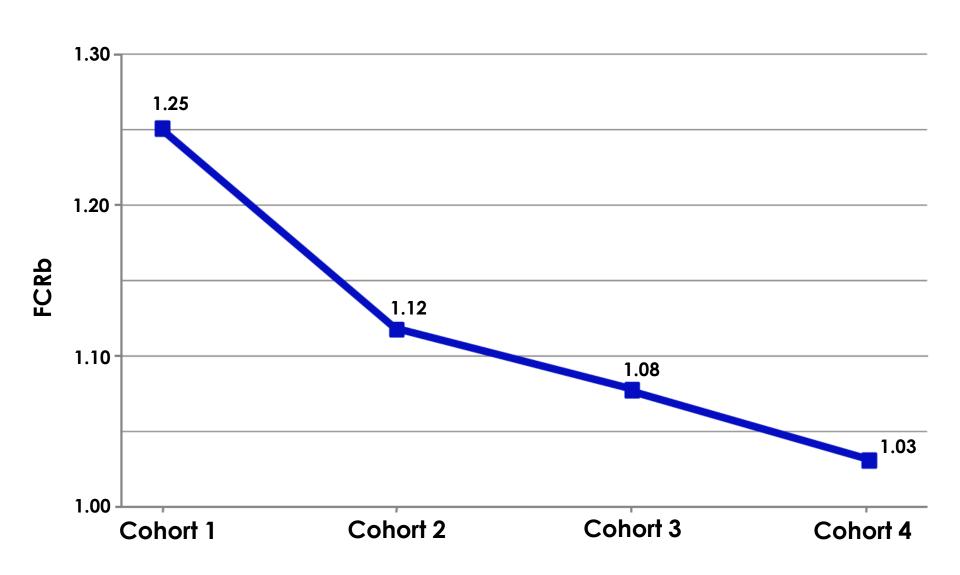

Growth (actual TGC)

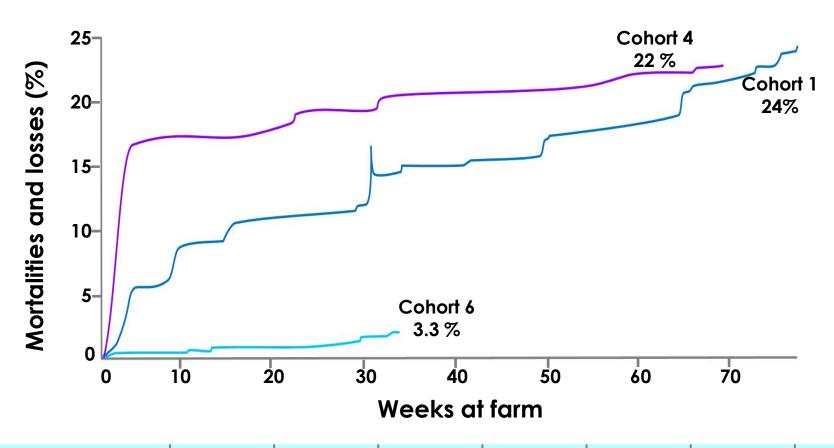

Feed conversion ratio FCR

Mortality

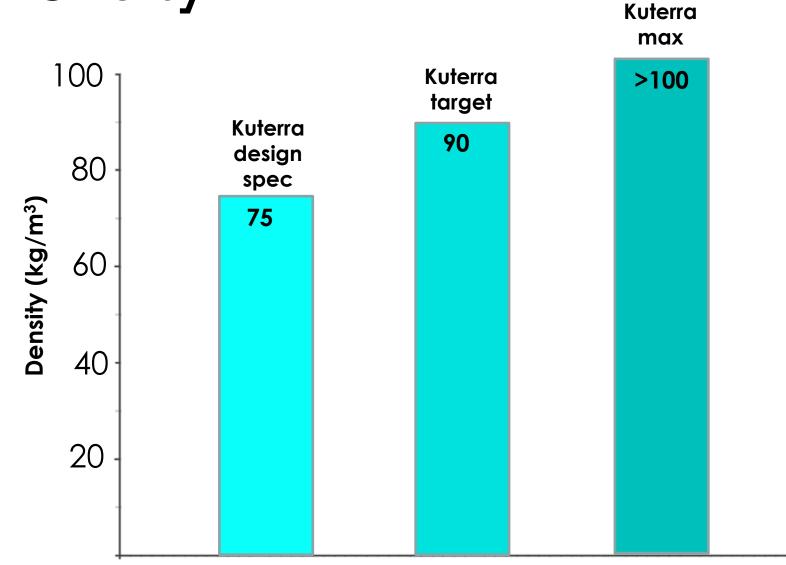

Cohort	1	2	3	4	5	6	7
Mortality ($\%$)	24	13	29	22	6.4	3.3	3.4
Weeks at farm	harvest	harvest	harvest	harvest	50	39	27

Density

Early maturation

When fish mature:

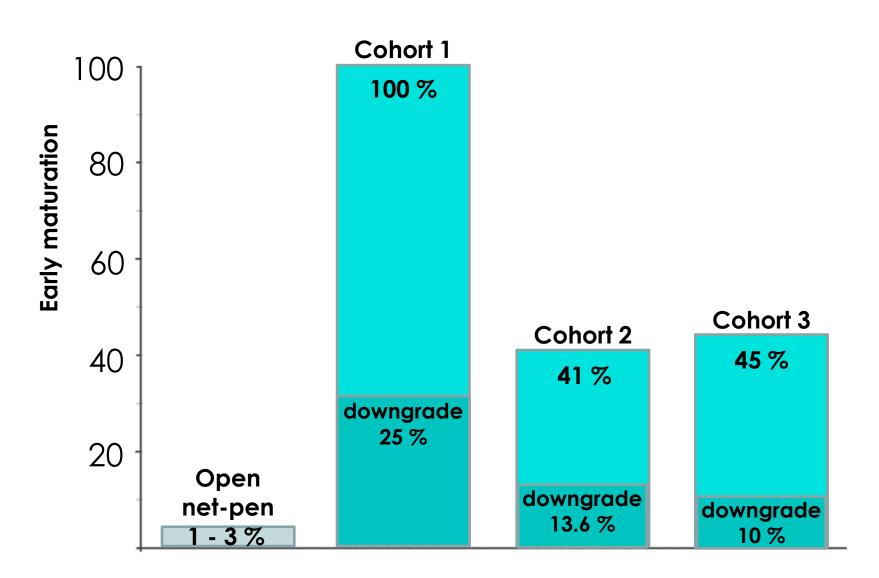

- Food energy goes to their reproductive systems.
- Body growth slows dramatically.
- Body shape changes.
- Flesh pales. Skin darkens.
- Flavour changes.

Financial impacts from early maturation:

- Non-premium fish
- Reduced revenues 50%/lb

Early maturation

Metrics review

2011 projected vs 2015 actual performance metrics

	2011 projected	2015 actual
TGC	2.50	1.64
FCRb	1.05	1.03
Mortality	7.6 %	6.4 %
Density	90 kg/m³	>100 kg/m ³
Harvest size	3-6 kg	3 kg

Optimizing performance

- Improve growth
- Reduce early maturation
- Reduce cataracts
- Determine optimal salinity

Economic feasibility

DEFINITION: Return on capital > 20 % **LOOKS PROMISING AT SCALE.**

Production costs

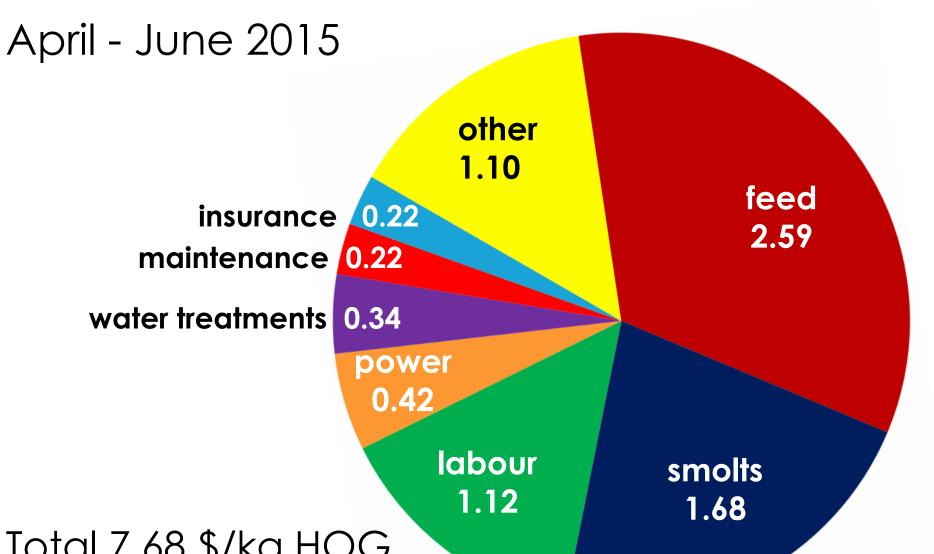

^{* \$} CDN are used throughout this presentation.

Production costs

Total 7.68 \$/kg HOG

Economics review

2011 vs 2015 costs (\$/kg HOG)

	2011 projected	2015 actual
Capital cost	\$17/y	* \$24/y
Revenue	\$5.99	** \$9.04
Kevelide	33.77	\$7.04
Feed	\$ 2.10	\$ 2.29
Labour	0.90	1.12
Smolts	0.87	1.68
Power	0.43	0.42
Other	1.04	1.88
Total production	5.34	7.69

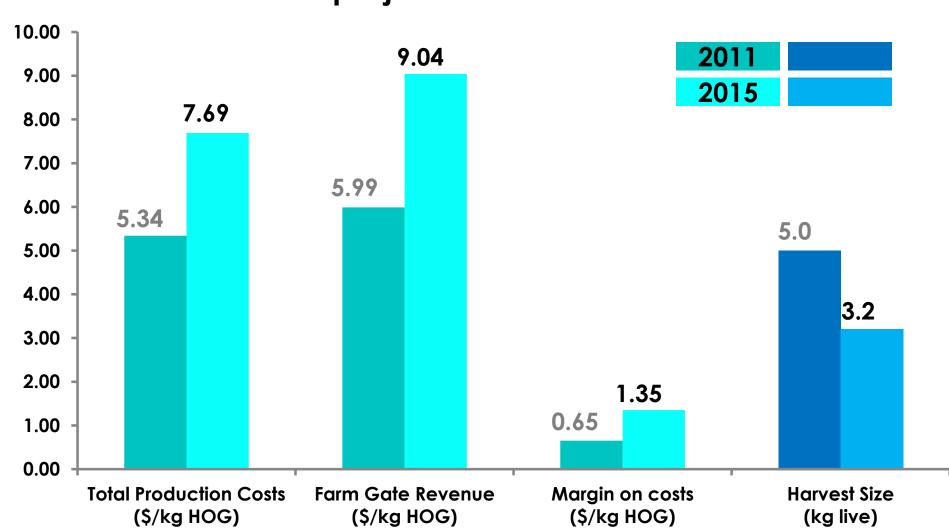

^{*} For 400 mt/y

^{**} Blended (premium and downgrades)

Economic review

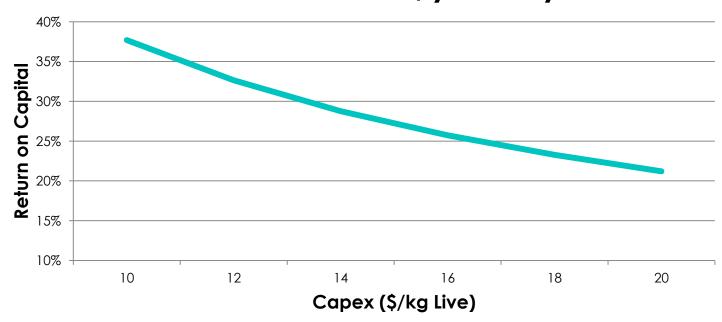

2011 projected vs 2015 actual

Return on Capital vs Capex (\$/kg live) for 3000 mT/y facility

Capex (\$/kg live)	10	12	14	16	18	20
Return on capital	38%	33%	29%	26%	23%	21%

ASSUMPTIONS

Capex: Construction cost (includes inventory build up)

Harvest: 6 kg live Downgrades: 5 % Smolts: \$2.50 ea

Product pricing

Substantial premium possible >30%

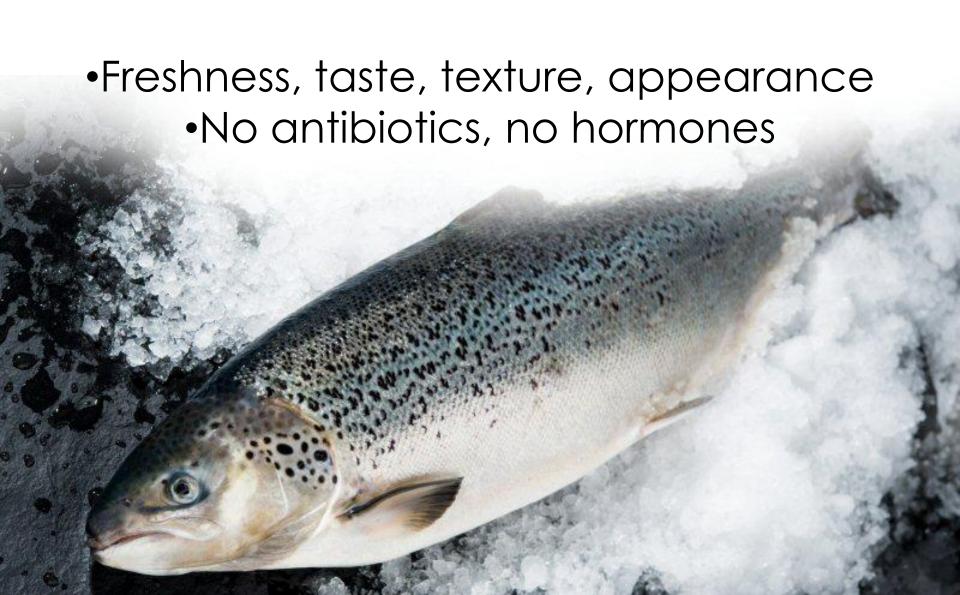

- Pricing risks:
- downgrades
- market saturation

Environment

Impacts and benefits

We've also busted myths

Land

Water

Fish Husbandry

What we've learned

What we've learned

Land-based RAS farming of Atlantic salmon:

- 1. Can be environmentally benign
- 2. Is technologically feasible
- 3. Is biologically feasible
- 4. Is expected to generate returns of > 20% per year at scale, once technological and biological elements are optimized.
